1 INTRODUCTION

1.1 Product overview

This project takes as input

- Physical machines and their capacities
- Virtual machines and their capacity requirements

It computes the residual capacity in each physical machine after adding the virtual machines. The physical machines are sorted in ascending order of their residual capacity. The project provides the feature of consolidating the virtual machines in different physical machines into minimum number of physical machines. Another feature provided by this project is to shutdown a physical system by migrating the virtual machines in that physical machine into other physical machines. This project uses greedy bin packing algorithm for this purpose.

2 SPECIFIC REQUIREMENTS

2.1 External Interface Requirements

2.1.1 User Interfaces

The GUI displays

- All the physical machines
- Virtual Machines in each physical machine
- Buttons for adding a vm, deleting a vm, for consolidation and turning off the physical machine

2.1.2 Hardware Interfaces

No specific hardware module is being used for this project

2.1.3 Software Interfaces

No specific hardware module is being used for this project

2.1.4 Communication Protocols

This project doesnt use any communication protocols

2.2 Software Product Features

1. Provides the ability to add a vm

This is fired by user clicking **Add VM** Button. A new window appears with fields for

- Capacity of the VM
- The PM in which to add the VM into

This would return

On Success: The GUI will be updated showing that new VM that is added to existing PM The residual capacity of the PM is calculated and update to reflect in GUI

On Failure:

The user will get an error message that there is no enough space to add the given VM

2. Provides the ability to delete a vm

This is fired by user clicking **Delete VM** Button. A new window appears with fields for

- Choosing the PM in which the VM we want to shutdown resides
- The ID of the VM that we want to shutdown

This would return

On Success: The GUI will be updated showing that new VM that is deleted from the PM The residual capacity of the PM is calculated and update to reflect in GUI

On Failure:

The user will get an error message that the particular PM which you have selected is empty or switched off

3. Ability to switch off a physical machine

This is fired by user clicking on the PM which he wants to shutdown.

This would result in

On Success:

The software moves all the VM's into other PM's with sufficient residual capacity. Then the system is shutdown. The GUI will be updated showing that the PM selected is switched off

On Failure:

The user will get a message stating that the VM's in the selected PM cannot be accomodated in other PM's.

4. Provides the ability to consolidate all VM's in minimum number of PM's

This action is fired by user clicking the **consolidate** Button.

This would result in

On Success:

The software runs Bin packing algorithm. Moves the VMs into as few PMs as possible. Updates the GUI

Use Case Add VM
